

COMPRESSIONGUARD® EXPANSION JOINT

Stop Damage from Street Creep

COMPRESSIONGUARD prevents expanding concrete streets from pushing on and cracking concrete driveways, garage slabs and foundation walls.

“Street creep” damage occurs when existing expansion joints between the street, driveway and garage slab are fully compressed, causing the concrete to push against the foundation walls. (Note: What may appear to be a perfect expansion joint is worthless if the two slabs are touching below the surface.)

To protect against long-term damage, CompressionGuard replaces the contractor-grade fiber-board expansion joints used in most residential driveways with an engineered expansion joint that can flex with concrete movement during seasonal changes.

CompressionGuard can be installed in a few hours—protecting property value, enhancing quality of life and restoring peace of mind for the lifespan of the driveway.

COMPRESSIONGUARD ADVANTAGES

Low-cost solution to ease pressure on garage slab and foundation walls

Can be installed year-round, even in extreme temperatures

Flush design and precise installation adds curb appeal

Environmentally friendly solution

Quick installation with minimal disruption

Driveway can be used right away after installation

WHY ARE YOUR GARAGE SLAB AND FOUNDATION CRACKING?

Concrete contracts as it cools and expands when it heats up. During cold winter months, cracks and joints in concrete slabs widen and fill with debris. When temperatures rise again, with those control joints now full of sand, pebbles and dirt, the concrete pavement actually “grows” a fraction of an inch each year. This results in elongation of the street, pushing against the driveway, garage slab and foundation walls of a home. This is commonly referred to as “street creep.”

THE PROVEN SOLUTION

1 Cut and remove a 3.5"-wide section of the driveway at optimal distance from the street.

2 Insert CompressionGuard for a flexible seal.

3 Protect driveway, garage floors and foundation walls from ongoing street expansion.

FIX & PROTECT

Save your concrete! Add the total Concrete Protection System, including PolyLevel® to lift and level slabs, NexusPro® to seal joints and cracks and SealantPro® to permanently seal surfaces.
