

Permanently Stabilize Your Foundation Walls

PN #MBWAH

GEOLock® WALL ANCHOR SYSTEM

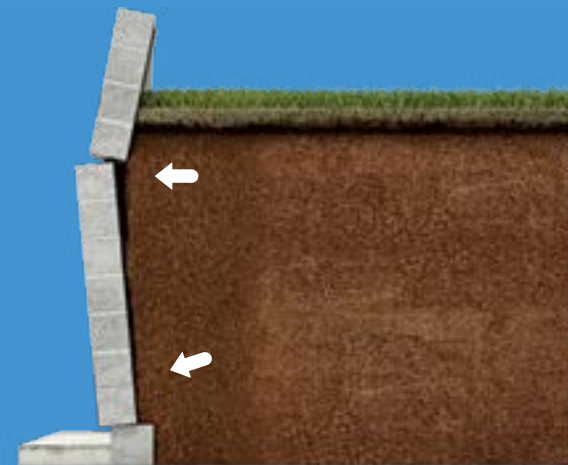

Happy Homes Demand Real Support.

YOUR HOME IS PRECIOUS. It's where you grow your family, welcome friends, and create lasting memories. Nothing should stand in the way of that. As your basement walls begin to crack, bow, and lean inward, the very foundation from which your life is built becomes compromised. Finding a permanent solution that addresses the true cause of your foundation problem is the surest way for you to get on with your life's happenings and enjoy peace of mind.

How did your walls get this way?

As forces of nature, such as moisture and frost, interact with the soil around your home, the soil expands. That expansion results in constant inward force on your foundation wall until it can no longer support the pressure, causing cracking, bowing, and tipping.

The Proven Solution

THE GEOLOCK® WALL ANCHOR SYSTEM exclusively from Foundation Supportworks, Inc. permanently stabilizes your foundation wall and in many cases can straighten your wall back toward its original position. Heavy-duty earth anchors are embedded in stable soil away from your foundation wall, and are then connected to steel wall plates with long, galvanized rods.

Once tightened, the anchors will hold the wall securely in its current position without any further adjustment. However, a unique benefit of the system includes the ability to tighten the anchors during dry seasons, meaning you can improve and even completely straighten your walls over time.

GeoLock Wall Anchor Systems are installed year-round, often in less than one day. Restore your property value and enjoy peace of mind right away.

**Our Promise,
Your Property**

Rest assured that the GeoLock System will immediately stabilize your foundation walls and permanently protect them against any further movement. The GeoLock solution comes with a 25-year warranty against manufacturing defects and a performance warranty from your local dealer.

ADVANTAGES

Minimal disturbance to the home, lawn and landscaping

Easily concealed during basement finishing projects

Galvanized steel components look great and will never rust

Can be tightened over time to straighten the wall

Hide-A-Way® Wall Anchor Covers available

INSTALLATION

1

Carefully remove sod and auger small hole

2

Drive rod through hole, out into soil

3

Connect rod to earth anchor and attach wall plate

4

Replace soil and sod; tighten anchors
